

1, Explain behaviour of hub device

- Connecting multiple devices A, B, C to form a Network
- It is a Broadcast device
- Same time we cannot communicate is transfer the data
- It is a half duplex is work on layer 1

2, Explain behaviour of switch device

- when it send data to source mac it will create the mac table
- 1st time it will broadcast to all device
- 2nd time switch check the data under the table then it will unicast because it know the source mac
- it is work on layer 2 [Data link layer]

3, Explain behaviour of router device

- Router having a condition :
 ⇒ Different Network
- Routing table contain list of routes is routing table also.
 [Network ID, Prefix, Int name]

(Example)

- Forwarding a data packet to one Network to other or another Network it called Routing
- It is unicast device work on layer 3.
